Company Profile

Oman Cables Industry (SAOG) develops, manufactures and markets a totally integrated variety of electrical products, which include **medium voltage power cables**, low voltage power and control cables, pilot cables, overhead power transmission line conductors and building wires.

OCI offers cables with special features suitable for different types of applications, environmental conditions or as per customer requirement.

- Flame Retardant Properties
- Low Smoke and Fume (LSF) Properties
- Cables with Anti-Termite Sheaths
- UV Resistant Outer Sheath
- Lead Sheath

The manufacturing facilities are situated within the largest industrial complex in Muscat, The Sultanate of Oman, with its offices and factory presently occupying an area of 135000 sqm with future expansion plans in mind. OCI have equivalent facilities in Sohar, Oman at its Aluminum manufacturing facility and together has a capacity of copper and aluminum of more than 120,000 MT annually.

Oman Cables Industry (SAOG) has its offices in Oman, UAE, Qatar, and KSA and has an extensive network of distributors and agents throughout MENA, Asia and Europe.

Product Range

Voltage Grade :	3.6/6/7.2 kV To 18/30/36 kV (Uo/U/Um) As Per IEC-60502-2 (Equivalent 3.8/6.6/7.2 kV To 19/33/36 kV - (Uo/U/Um) As Per BS 6622)
Conductor :	Copper or Aluminium
Conductor Size :	25 To 1000 Sq. mm
Specification :	IEC 60502 Part 2, BS 6622, or Any Other International specification covering above voltage range
Uo :	Nominal Phase To Earth Voltage
U :	Nominal Phase To Phase Voltage
Um :	Maximum Phase To Phase Voltage

Special Features

OCI can also offer cables with different sheathing, screening, taping & armouring options as per customer's specific requirements. We can also offer cables suitable for superior fire performance characteristics as well as with low smoke & fume (LSF or LSOH/LSZH) properties. Special features like longitudinal water sealing of conductors & CU screens, radial water sealing of CU screens as well as different colour of outer sheath can be provided on request.

The cable design in this catalogue conforms to IEC 60502 Part 2 & in most cases to BS 6622. However if requested, **we can separately offer guaranteed technical particulars for cables as per different international specifications or specific customer needs.**

Constructional Features

Conductor

We can offer cables with both copper or aluminium conductors. Conductors upto 1000 sq mm will be circular compacted & stranded and shall comply with IEC-60228 Class 2.

Conductor screen

This will be an extruded layer of semiconducting XLPE applied under simultaneous triple extrusion process over the conductor along with the insulation and the insulation screen.

Insulation

This will be an extruded layer of insulating grade XLPE applied over conductor screen under triple extrusion process along with conductor screen and insulation screen.

Insulation screen

This will be a layer of semiconducting XLPE which will be applied by triple extrusion process over the insulation.

Metallic screen

It will consist of a layer of copper tape applied helically with overlap over insulation screen. Other combinations of metallic screens as per customer's requirement can also be provided on request.

Laying-up

In case of three core cables, the three cores are laid up with non hygroscopic fillers like polypropylene (PP) fillers at interstices and a binder tape is applied with an overlap. These binder tapes can be a PVC or Polyethylene, or Polypropylene or Polyester.

Inner Sheath (Bedding)

Extruded layer of PVC or PE is applied over the laid-up cores. PVC is normally of grade ST2 or PE of grade ST7 as per IEC 60502 Part 2.

Armour

In case of Armoured cables, the armour is applied over inner sheath. For Single core cables this is of aluminium wires and for multicore cables the armour can be of one among the following options:-

- a) Galvanized steel wire.
- b) Galvanized steel tape.

The armour is applied helically over the inner sheath.

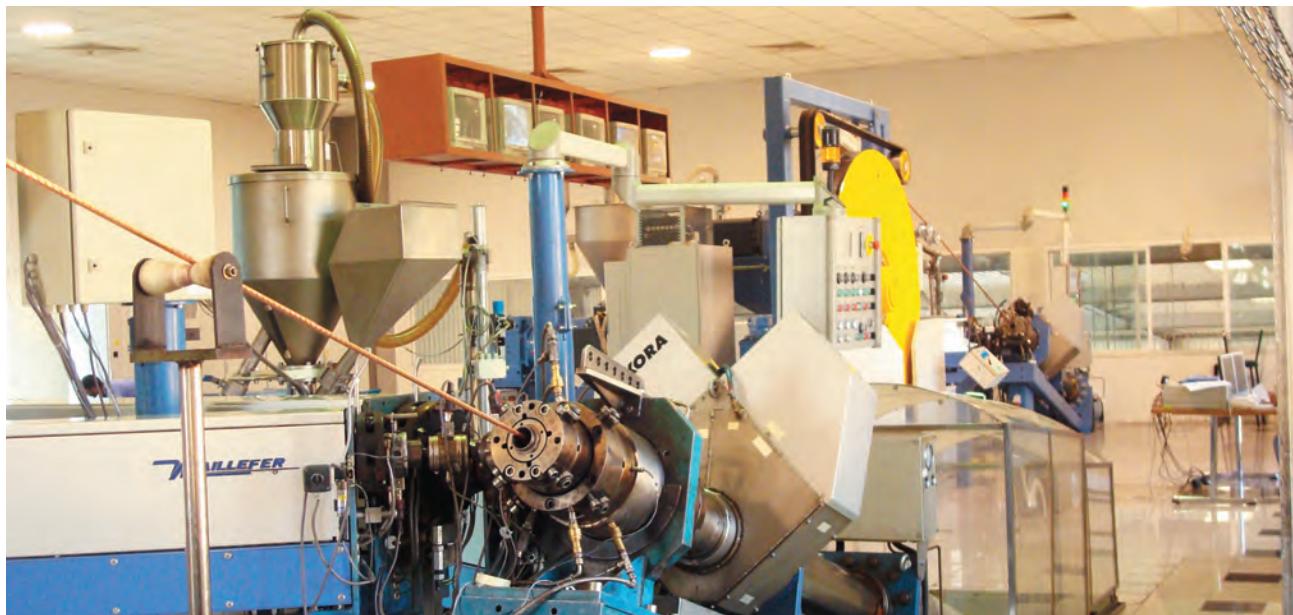

Outer sheath

An extruded layer is applied over the armour in case of armoured cables and over the laid-up cores (for multi core)/copper screen (for single core) in case of unarmoured cables. Outer sheath material can be either PVC of grade ST2 or PE of grade ST7 as per IEC-60502 Part 2.

Special features which we can offer

- Water tight construction (both radial & longitudinal for Cu screen and Longitudinal for conductor)
- Strippable insulation screen
- TR-XLPE insulation
- Metallic screen of multiple layers of copper tapes or a combination of copper wires and tapes to increase the earth fault current carrying capacity.
- Increased armour conductivity by way of insertion of tinned copper wires in armour.
- UV resistant coloured outer sheath.
- LSF (Low Smoke & Fume) (LSOH/LSZH) MV cables as per BS 7835 with LSF (LSOH/LSZH) inner/outer sheath.
- Flame Retardant MV cables conforming to IEC 60332
- FR-PVC or FRRT - PVC or FRLS-PVC inner sheath and/or outer sheath
- Graphite coating on outer sheath.

Plant and Machinery

Triple Head Extrusion - CCV Plant

The medium voltage cable manufacturing facility at OCI is the most modern facility available in the region today with the state of the art machinery & equipment supplied by the biggest & the best names in the cable manufacturing machinery industry. The entire MV cables manufacturing plant at OCI is fully air-conditioned with humidity control to ensure contamination free atmosphere, the only kind in the whole of Middle East.

The heart of the MV cables manufacturing facility is the CCV line. These lines are supplied by Maillefer, Finland and incorporates some of the most modern features like,

- Triple extrusion head to ensure superior quality of extrusion and uniform bonding of conductor screen, XLPE insulation & the insulation screen.
- In line X-ray machine for checking proper concentricity of all 3 layers of Insulation as well as measuring thickness of extruded materials, ovality and overall diameter.
- CDCC - Completely Dry Curing & Cooling in an inert atmosphere of nitrogen.
- Fully Computerized auto-cure control system which controls all driving parameters to achieve best curing of extruded materials.
- Fully automatic compound handling system ensuring a contamination free line, which is

absolutely essential to achieve a superior quality product.

Some Of The Other Machines Include:

- Central stranding machine from SKET Germany
- Combined CU taping & Multi wire screening machine from Pourtier France
- 3000 mm Drum twister Laying-up machine from SKET Germany
- 3000 mm Drum twister Armouring machine from Pourtier France
- Combined 3000 mm Drum twister Laying-up & Armouring machine from Pourtier France
- Steel tape Armouring machine from Pourtier France
- Extrusion sheathing lines from Maillefer Finland and from Troester Germany
- Lead extruder from HFSAB Sweden.

With the manufacturing facilities incorporating the use of latest available technology, the MV cables offered by OCI provides customers with a definite advantage in terms of:

- Complete adherence to specifications,
- Superior overall performance,
- Minimum risk of insulation failures,
- Much longer service life.

MV Cables Testing Facility

OCI has made a major investment in the Testing facilities for its MV Cables factory. We have equipped ourselves with the latest and most advanced cable testing facility available in the world.

All testing equipment such as Partial discharge detector, High Voltage Tester, Tan delta bridge and Impulse tester are supplied and erected by Hipotronics USA/Haefely & Tattex Switzerland.

The screened room for 'Partial Discharge' Test has been supplied & erected by M/s ETS Lindgren, UK, who are the world leaders in interference technology products. This facility is the first of its kind in the region & ensures detecting discharge levels less than 1pC.

Apart from the above, the other major testing facilities include:

- a) Partial Discharge detector from M/s Hipotronics (Robinson) USA
- b) 1000 kVA/100 kV - Series Resonance Test set with fully automatic control system - from M/s Hipotronics, USA.
- c) 1500 kVA/120 kV - Series Resonance test set with fully automatic control system from M/s Haefely Switzerland.
- d) 300 kV/15 kJ - Latest Impulse Test facility from M/s Haefely, Switzerland.
- e) Fully automatic 'Tan delta' measuring facility from M/s Tettex, Switzerland.

We have also installed many in line devices/facilities for checking the product quality during the manufacturing process, examples of this are the X-Ray machine installed on the CCV line, Curing Optimization Software, online conductor resistance measurement device etc. These features reduce any risk of failure and ensure a long service life for our products.

Control Panel

In Line X ray Unit

With this modern equipment & facilities, we ensure close manufacturing tolerances and compliance to customer specifications as well as effective monitoring of the entire manufacturing process to ensure a world class product.

OCI's quality management system is accredited to ISO 9001 by BASEC, UK. The design validation for our MV Cables range has been done at recognized international laboratories.

With the above state of the art Testing Facility, we can conduct all Routine Tests, Type Tests and Sample Tests mentioned in IEC 60502 Part 2, BS 6622 & other international specifications, in-house. 100% of the cables manufactured by OCI are routine tested prior to dispatch, however if the customers desire to witness these tests or other Type / Sample tests, they can nominate their representatives or appoint a third party to witness the same at OCI factory.

Oman Cables Quality Assurance

In order to ensure the best quality products, it is essential to test and inspect the product at each stage of manufacturing including raw materials and finished product.

Oman Cables Quality Assurance System includes:

- A. Raw Materials Inspection
- B. In-process inspection
- C. Finished product inspection

Raw Materials Inspection:

All the raw materials are sourced from internationally approved companies, known for their quality products. Once the material is received with their product certificate, Oman Cables quality team tests and inspects the same again. Only those materials which meet Oman Cables internal standards are released for production.

In-Process Inspection:

A team of well experienced and qualified personnel, dedicated to quality, inspects and test all the in-process materials at every stage, and only materials complying to the specified requirements are released for processing.

Finished Product Inspection:

Oman Cables products are fully tested to the applicable standard to which it is manufactured before leaving the factory.

Routine tests are carried out for conformity to the specifications on 100% cable drums. Sample tests and type tests are carried out at regular intervals as per the applicable standards to confirm the product quality.

Testing Laboratory

Notes on FRLS and FR Sheathed Cables

Oxygen Index (ASTM D 2863)

The criterion for burning is presence of percentage of oxygen in air. By mixing oxygen and nitrogen at various percentages this test finds at what percentage of oxygen the standard specimen starts burning. Higher the oxygen index higher the resistance to get ignited. Min. oxygen index shall be 30%.

Temperature Index (ASTM D 2863)

Temperature index is the temperature at which the oxygen index of the material becomes 21. This test is carried out usually by extrapolation after the oxygen index is measured at various temperatures. Minimum temperature index shall be 250 °C.

Smoke Density (ASTM D 2843)

This parameter relates to measuring and observing relative amounts of smoke produced by the burning or decomposition of materials. This test is carried out in accordance with ASTM D 2843. The measurements are made in terms of loss of light transmission through a collected volume of smoke produced under control standardized conditions. Generally requirement by customer is smoke density rating less than 60%.

Acid Gas Emission (IEC 60754-1)

During burning of cable materials acid gases are evolved especially hydrogen chloride. The gas

emission is evaluated in accordance with test method IEC 60754-1, where approximately 1 gm. of the material is pyrolysed at 800 °C in a combustion tube and resultant gases are analyzed.

Flame Retardance (IEC 60332-1)

A single cable sample is clamped vertically. The Bunsen or other similar burner is arranged at 45 Degree to the axis of the cable sample, applying flame at 475 mm below to top clamp. The flame is applied for a period of time depending upon the diameter of the cable.

The test requirement is that after all burning has ceased the charred or affected portion shall not have reached within 50 mm from the top clamp.

Flame Retardance Test (IEC 60332 -3)

This test is carried out to check flame retardant properties of bunched cables. Three categories of tests namely category "A", "B" and "C" have been defined according to quantity of combustible material available over unit length. Cable pieces are tied on vertical ladder and flame is applied from a horizontal ladder. After the specified time the burner is removed. All parameters are pre defined according to specification. The charred portion is measured and compared with the standards to decide on acceptability.

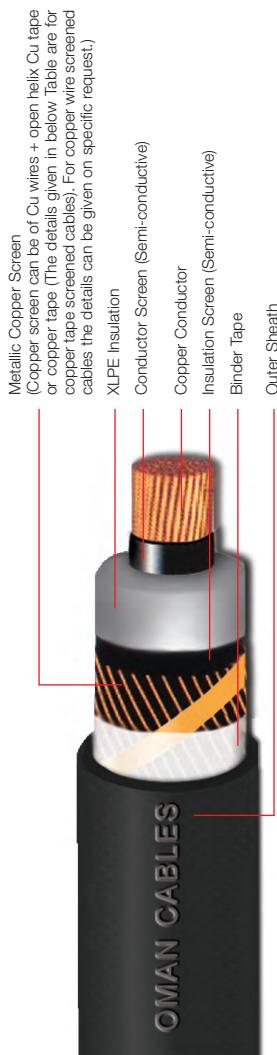

Special PVC Compounds with Additional Requirements which OCI can provide:

Property		Material	
	FR	FRLS	FRRT
Oxygen Index (Min.)	30	30	30
Temperature Index (Min.)	250	250	250
Smoke Density Rating (Max.)	-	60	-
Acid Gas Generation (Max.)	-	20 %	17%
Flammability Test*	IEC 60332-1 and IEC 60332-3-24	IEC 60332-1 and IEC 60332-3-24	IEC 60332-1 and IEC 60332-3-24

* Based on specific request, we can provide compounds which can meet flammability requirements of IEC 60332-3-23 and IEC 60332-3-22

	Spaced	1	1.00	1.00	0.98	0.95	0.91	-
		2	1.00	0.99	0.96	0.92	0.87	-
		3	1.00	0.98	0.95	0.91	0.85	-
Cables on vertical perforated trays	Touching	1	1.00	0.88	0.82	0.78	0.73	0.72
		2	1.00	0.88	0.81	0.76	0.71	0.70
	Spaced	1	1.00	0.91	0.89	0.88	0.87	-
		2	1.00	0.91	0.88	0.87	0.85	-
Cables on ladder supports, cleats, etc	Touching	1	1.00	0.87	0.82	0.80	0.79	0.78
		2	1.00	0.86	0.80	0.78	0.76	0.73
		3	1.00	0.85	0.79	0.76	0.73	0.70
	Spaced	1	1.00	1.00	1.00	1.00	1.00	-
		2	1.00	0.99	0.98	0.97	0.96	-
		3	1.00	0.98	0.97	0.96	0.93	-

Note 1: Values are given for vertical spacings between trays of 300 mm and at least 20 mm between trays and wall. For closer spacing, the factors should be reduced.

Note 2: Values are given for horizontal spacing between trays of 225 mm with trays mounted back to back. For closer spacing, the factors should be reduced.

SECTION F - TABLE 14

GROUP RATING FACTORS FOR GROUPS OF MORE THAN ONE CIRCUIT OF SINGLE-CORE CABLES - TO BE APPLIED TO THE CURRENT - CARRYING CAPACITY FOR ONE CIRCUIT OF SINGLE - CORE CABLES IN FREE AIR

Method of Installation	Number of trays	Number of three-phase circuits (Note 3)			Use as a multiplier to rating for
		1	2	3	
Perforated trays (Note 1)	1	1.00	0.98	0.96	Three cables in trefoil formation
	2	0.97	0.93	0.89	
	3	0.96	0.92	0.86	
Vertical perforated trays (Note 2)	1	1.00	0.91	0.89	Three cables in trefoil formation
	2	1.00	0.90	0.86	
Ladder supports, cleats, etc. (Note 1)	1	1.00	1.00	1.00	
	2	0.97	0.95	0.93	
	3	0.96	0.94	0.90	

Note 1: Values are given for vertical spacings between trays of 300 mm. For closer spacing, the factors should be reduced.

Note 2: Values are given for horizontal spacing between trays of 225 mm with trays mounted back to back. For closer spacing, the factors should be reduced.

Note 3: For circuits having more than one cable in parallel per phase, each three phase set of conductors should be considered as a circuit for the purpose of this table.

SECTION F - TABLE 15

RECOMMENDED MINIMUM BEDING RADIUS (FOR PVC SHEATHED CABLES)

TYPE OF CABLE	DURING INSTALLATION	DURING TERMINATION
(A) SINGLE CORE		
Unarmoured	20 x D	15 x D
Armoured	15 x D	12 X D
(B) THREE CORE		
Unarmoured	15 x D	12 x D
Armoured (SWA)	12 x D	10 x D
Armoured (Steel Tape)	15 x D	15 x D
D - Overall diameter of cable		

SECTION F - TABLE 16

D.C. TEST VOLTAGE AFTER INSTALLATION*

VOLTAGE GRADE (kV)	D.C. VOLTAGE (kV) (TEST DURATION - 15 MINUTES)
3.6/6	15
6/10	24
8.7/15	35
12/20	48
18/30	72

* Given test voltages are for New installation only (Reference - IEC - 60502-2)

SECTION F - TABLE 17

Copper wire screen area for Single core unarmoured cable

It is always advisable to design the cable for specific fault current as per the system requirement. However as a common practice copper wire screen area as per the table given below may be provided for single core unarmoured cables. This screen area is irrespective of voltage grade of the cable.

Conductor cross-sectional area (mm ²)	Copper wire screen area (mm ²)
25-120	16
150-300	25
400 and above	35

Short Circuit Charts

SHORT CIRCUIT RATING

The short circuit ratings (r.m.s. values) of XLPE insulated cables have been calculated on the following assumptions.

1. Conductor temperature prior to short circuit	90 °C
2. Max permissible temperature during short circuit	250 °C
3. Specific gravity	
a. Copper	8.89 gm/cc
b. Aluminium	2.703 gm/cc
4. Resistivity	
a. Copper	17.241 X 10 ⁻⁶ Ω mm
b. Aluminium	28.264 X 10 ⁻⁶ Ω mm

The Maximum short circuit current is calculated with the following formula

$$I_{sh} = \sqrt{\frac{K \times A}{t}} \text{ (kA)}$$

Where I_{sh} = r.m.s. value of short circuit current (kA)

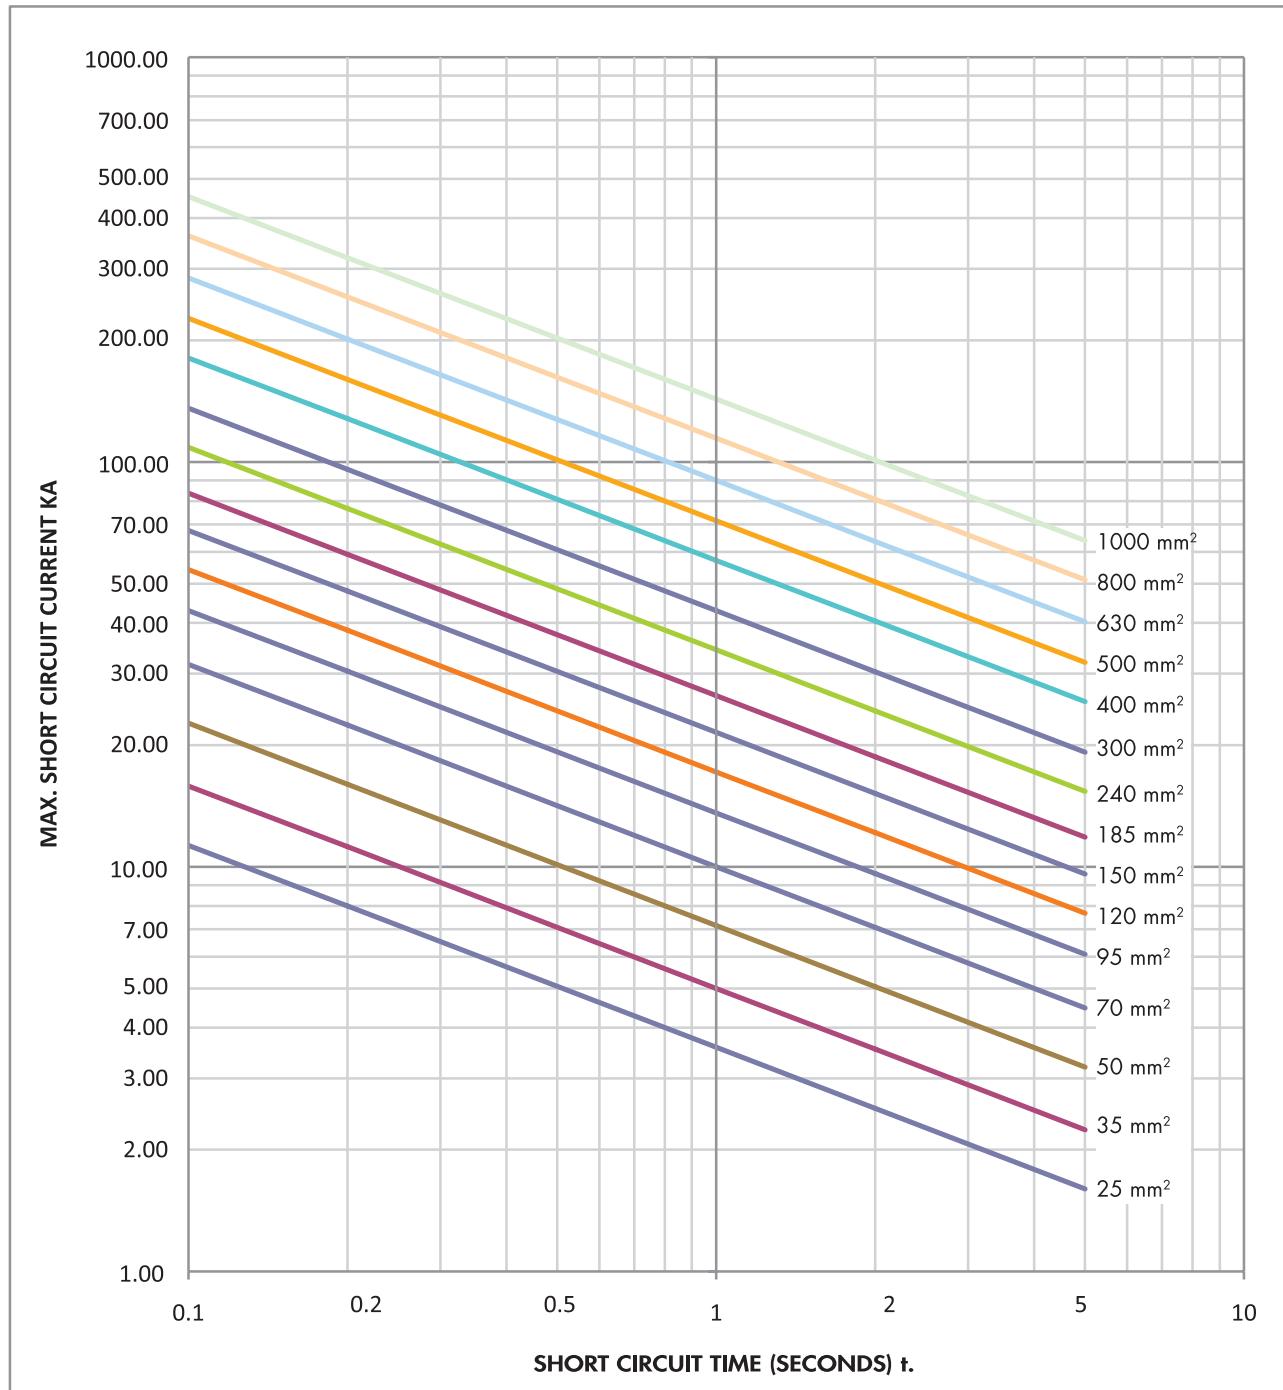

K = a constant (0.143 & 0.094 for copper & aluminum respectively)

A = nominal area of the conductor (mm²)

t = duration of the short circuit (sec)

Short Circuit Characteristics

Laying and Installation of Cables

- After arrival at the site the cable should be examined visually to check any exterior damage.
- At site the cable drum should be rolled only in the direction shown on the flange otherwise the cable may become loose & hence difficult to handle.
- The route of the cable should be decided before hand considering the points like transportation of the cable at these points, atmosphere and ground conditions, where joints and terminations will be done, etc.
- While laying up the cable minimum bending radius as required to be strictly maintained.
- If the cable is pulled by pulling eye or winch, utmost care should be taken that tensile stress on the cable is within its limit.
- If the cable is laid in duct or pipe, outer diameter of the duct or pipe should be at least 1.5 times the diameter of the cable.
- Suitable derating factors should be applied as per the environmental & installation conditions while selecting the size of the cable.
- After laying up the cable system must be subject to the DC voltage as mentioned in the table no. 17. The system should be energized after it has withstood this test.

Special Guidelines for LSF (LSOH/LSZH) sheathed cables

LSF (low smoke & fume) (LSOH/LSZH) sheath does not have the same mechanical strength as other sheath material, particularly at higher temperatures.

It is therefore recommended that LSF (LSOH/LSZH) sheathed cables should be used mainly indoors, and only where cables have been specified to have low smoke and toxic gas emission property.

Installation

We recommend the following special guidelines, in conjunction with the standard installation instructions.

- The cables should be stored in proper packed condition, in the shade and direct exposure to sun should be avoided.
- As LSF (LSOH/LSZH) has lower tear strength property as compared to PVC/PE sheath, special care should be taken during installation to avoid any damage. Even a small cut on the LSF (LSOH/LSZH) sheath could result in sheath cracking, as it will run in longitudinal direction due to lower tear strength property of LSF (LSOH/LSZH) sheath.
- Use pay-in rollers and corner rollers of non-metallic material (Nylon or Teflon) at least every 3 to 4 meters while laying the cable.
- As far as possible installation should be undercover or indoors. For outdoor installation, direct exposure to sunlight should be avoided by using a suitable cable tray.
- The cables should not be in contact with any hot surface.
- The requirement of minimum bending radius should be followed as per data sheet.
- Any clamping device should not be applied directly on the outer sheath. There should be some cushion (for instance a rubber pad of approx. 3 mm thickness) between the cable's outer sheath and clamps.
- Maximum distance of unsupported length of cable for horizontal and vertical run should be as below:

Overall diameter of cable (mm)	Max. spacing between the supports for horizontal run (mm)	Max. spacing between the supports for vertical run (mm)
0-14.9	350	450
15-19.9	400	550
20-39.9	450	600
40-59.9	700	900
60 & above	1100	1300

Re-winding

In case re-winding should be necessary, extreme caution should be taken during the process to avoid damage. The following should be adhered to :

- The winding should be done equally and uniformly with no over-riding of the coils or pinching on the sides of the drum.
- The pay-off drum should have an adequate braking system to prevent the cable from coming loose on the drum.

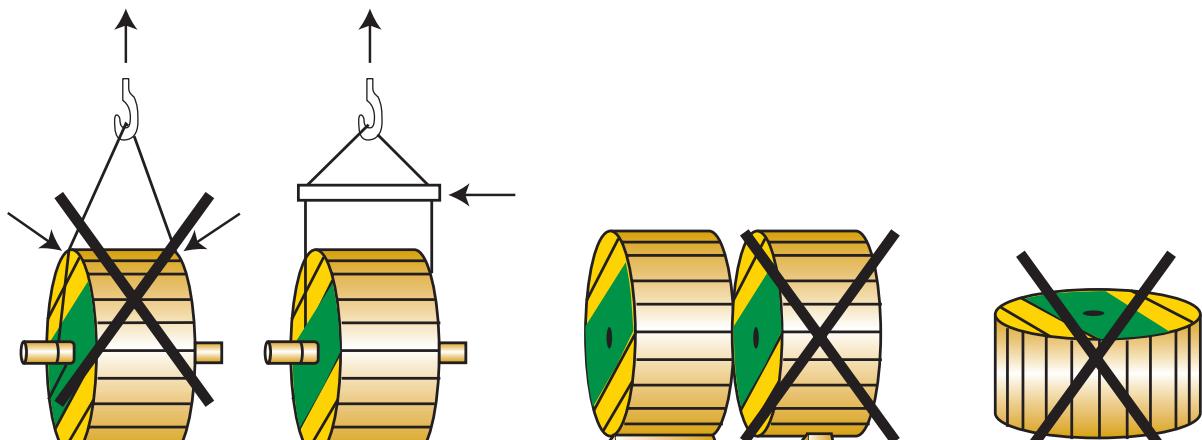

Cable Construction Coding Chart

ABBREVIATION	DESCRIPTION
Blank (No Code)	Cooper Conductor
A	Aluminium Conductor
2X	XLPE Insulation
C	Copper Screen for Single core Cable
CE	Individual core Copper Screen for Three core Cable
S	Collective Screen for Three core Cable
Wa	Aluminium Wire Armour
W	Steel Wire Armour
Tg	Double Steel Tape Armour
F	Flat Strip Armour
Y	PVC Sheath
2Y	PE Sheath

Example: 3C X 120 mm², Copper Conductor, XLPE Insulated, copper tape screened over individual core, PVC bedding, round wire armoured and overall PVC sheathed cable, 3.6/6 kV.

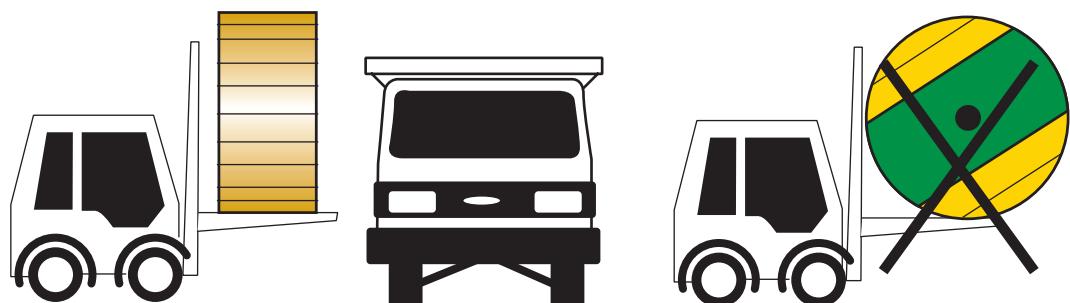

Hence cable can be denoted as : 3C x 120 mm², 2XCEWY, 3.6/6 kV

Drum Handling Instructions

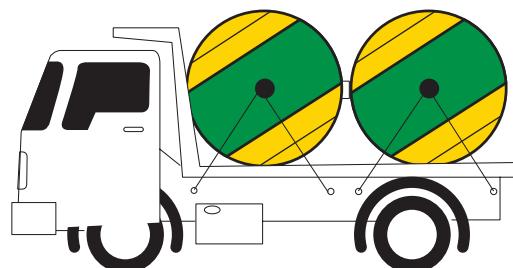

Lifting cable drums using crane

Do not lay drums flat on their sides, use proper wedges to prevent drums rolling

Lift drums on fork trucks correctly

Secure drums adequately before transportation

Roll in the direction shown by the arrow

Recommendations for the selection of cables rated voltage

The rated voltage of the cable for a given application should be suitable for the operating conditions in the system in which the cable is used. To facilitate the selection of the cable, systems are divided into three categories as follows:

- a) **Category A:** This category comprises those systems in which any phase conductor that comes in contact with earth or an earth conductor is disconnected from the system within 1 min.
- b) **Category B:** This category comprises those systems which, under fault conditions, are operated for a short time with one phase earthed. IEC 60183 recommends that this period should not exceed 1 h. For cables specified in BS 6622/IEC-60502-2, a longer period, not exceeding 8 h on any occasion, can be tolerated. The total duration of earth faults in any year should not exceed 125 h.
- c) **Category C:** This category comprises all systems which do not fall into categories A or B.

NOTE: In a system in which an earth fault is not automatically and promptly isolated, the extra stresses on the insulation of cables during the earth fault might reduce the life of the cables. If the system is expected to be operated fairly often with a permanent earth fault, it might be advisable to classify the system as category C.

The below Table gives the lowest rated voltage of cable that should be used according to the system voltage and category.

Selection of cables for three-phase A.C. systems

System voltage		System category	Minimum rated voltage of cable, U_0/U
Nominal voltage, U	Maximum sustained voltage, U_m		
kV	kV		kV
6.6 or 6	7.2	A or B	3.6/6
6.6 or 6	7.2	C	6/10
11 or 10	12	A or B	6/10
11 or 10	12	C	8.7/15
15	17.5	A or B	8.7/15
15	17.5	C	12/20
22 or 20	24	A or B	12/20
22 or 20	24	C	18/30
33 or 30	36	A or B	18/30

The nominal system voltage, U, given in above Table is the nominal voltage between phases.

The maximum sustained system voltage U_m , is the highest voltage between phases that can be sustained under normal operating conditions at any time and at any point in the system. It excludes transient voltage variations, due to lightning impulses, fault conditions and rapid disconnection of loads.

The normal system voltages shown in above Table are generally in accordance with series 1 as given in IEC 60038. For system voltages intermediate between the values in above Table, the cable should be selected with a rated voltage not less than the next highest value (e.g. for a 13.8 kV system of category A or B, the cable should have a rated voltage not less than 8.7/15 kV and for a 13.8 kV system of category C, not less than 12/20 kV).

TRULY OMANI TRUSTED GLOBALLY

FACTORY & HEAD OFFICE & LOCAL SALES OFFICE

Plot No 206, Road No 2, PO Box 25, Rusayl, 124 PC 124 Sultanate of Oman
